Circular Solutions

Key question asked in the game: What kind of solution is it?

CLARIFICATION:

IT application/solution	An IT-based solution aims to enhance management in the circular economy. This may include data monitoring and analysis systems, online trading platforms, tools for tracking resource flows, or waste management software. These applications assist in process optimization, identifying recycling opportunities, product tracking, and resource management.
Technology of the production	Technological solutions in the circular economy aim to replace traditional, resource-intensive production methods with more efficient and sustainable technologies. This can involve the use of renewable energy, low-resource and low-energy consumption manufacturing processes, the utilization of renewable materials, or the ability to recover resources during production.
Procedure/methodology /certificate	Implementing appropriate procedures and methodologies is crucial in the circular economy. This may involve waste management systems, recycling procedures, rigorous monitoring and control of production processes, as well as educating employees on sustainable practices. Procedures and methodologies help maximise efficiency, minimise waste, and incorporate principles of sustainable development throughout the product life cycle. In some cases, the aforementioned changes are connected with certification system so formal confirmation that the company uses new approach or solution.
CE raw materials purchasing	Purchasing the raw materials that derive from the recycling process can change the company in the production perspective from the traditional to CE model. That kind of solutions are now available on the market and companies can use the existing offer or order the dedicated solution constructed in the way suitable for the company and its specific circumstances and technology level.
Business relations/cooperation on CE model	Business relations can affect the company by showing the solutions that can optimize product/service processes. It can develop and strengthening relationships with clients but also create the space for stronger value chain, transfer and sharing of knowledge between company and surrounding environment.
